MDVLCraft: Proposed Origin Abilities

Six ability ideas for each Martial class (17) and each Job (16), 198 in all, for the planned **Origin** skill-tree tab. Pick the ones you want (two per origin was the plan, but any number works). Each idea has an ID such as **M3-4** (Martial class 3, idea 4) or **J10-2** (Job 10, idea 2), so you can just list IDs.

How the tab would work. A new tab next to the vocation trees. Its tree is made of two halves joined at a shared start node: the half for your Martial class and the half for your Job, the same way the two archetype bases join in a vocation tree. Each half has its chosen abilities as big nodes, each in a ring of small bonus nodes themed to that origin (e.g. Cavalry: mount speed, pet and mount damage, fall damage reduction; Miner: armour, double drop chance, fortune, step height; Bard: cooldown reduction, max stamina, healing received). The layout uses the same web style as the vocation trees. Nitwit has no half.

Rules kept: no teleporting, no flight and no breaking blocks. "Dash" and "leap backward" ideas slide you along the ground; "pull" ideas move the target, never you. Anything that places something (traps, wards, walls of spikes) is a temporary entity or zone, not real blocks. The line under each origin says what it already does, so the ideas build on it instead of repeating it.

Martial classes
